Full-Stack Web Development Architecture & React 19 Reference

Production engineering blueprint: React Server Components, Actions hook ecosystem, state management patterns, JWT security, and Web Performance Core Web Vitals.

LITHAVEN CAMPUS STUDY VAULT • OFFICIAL REVISION CAPSULE

COURSE: Software Engineering & Web Architecture | **TARGET:** Frontend/Full-Stack SDE Roles & Production Apps

1. React 19 Paradigm Shift & Action Hooks Ecosystem

React 19 Primitive	Purpose & Execution Context	Code Pattern	Replaces Legacy Pattern
useActionState	Manages async action pending states, form submission, and returned data.	const [state, formAction, isPending] = useActionState(fn, init)	Eliminates manual useState(loading), useState(error), and try/catch handlers.
useOptimistic	Instantly reflects optimistic UI updates during background server mutations.	const [optList, setOptList] = useOptimistic(list, (state, update) => ...)	Replaces manual rollback state variables and complex local cache sync.
useFormStatus	Provides form status (pending, method, data) to child components without prop drilling.	const { pending } = useFormStatus(); return <button disabled={pending}>	Replaces passing isSubmitting prop down through form button hierarchies.
Server Components (RSC)	Executes exclusively on node server; zero JS sent to client bundle.	async function Page() { const data = await db.query(); return ... }	Replaces client-side useEffect() data fetching waterfall on initial load.

2. Full-Stack Security & API Architecture Guidelines

Architecture Layer	Security & Reliability Standard	Failure Mode / Vulnerability Prevented
Authentication	Short-lived JWT access tokens (15m in memory) + HttpOnly SameSite=Strict refresh cookies.	Prevents XSS token exfiltration; eliminates CSRF via SameSite cookie isolation.
Database Mutations	Strict Mongoose validation, prepared statements, and optimistic locking (__v).	Prevents SQL/NoSQL injection and concurrent lost-update write anomalies.
Rate Limiting	Token bucket IP & user rate limiting (Express rate-limit / Redis) on auth & search endpoints.	Prevents brute-force credential stuffing and DoS scraping floods.
Static Assets & Caching	Immutable Cache-Control headers with content-hash filenames (Vite dist).	Guarantees 100% cache hit ratio on CDN without serving stale application bundles.

3. Core Web Vitals (CWV) & Performance Standards

- **Largest Contentful Paint (LCP < 2.5s):** Preload hero images using <link rel='preload' as='image'>; avoid rendering hero images behind client-side waterfalls.
- **Interaction to Next Paint (INP < 200ms):** Yield long CPU tasks using scheduler.yield() or setTimeout(0); optimize heavy re-renders with React 19 transitions.
- **Cumulative Layout Shift (CLS < 0.1):** Always set explicit width, height, or aspect-ratio on images and dynamic embeds to avoid layout reflows.
- **Anti-Flash Theme Script:** Inline early DOM attribute setters (e.g. document.documentElement.setAttribute('data-theme', theme)) in <head> before CSS paints.
